PRINCIPLES OF BACKFLOW -

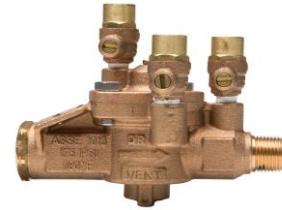

- What is Backflow?** Backflow is the unintended reverse flow of water from a property back into the drinking water supply
- Why is Backflow prevention important?** If there are contaminants in the water, backflow can cause serious or even fatal injuries
- How is backflow prevention achieved?** By the installation of an approved backflow prevention device
- Who can fit backflow prevention devices?** Accredited backflow plumbers and licensed plumbers
- What Backflow device do you need?** Your backflow device must be suitable for your property's hazard rating
- What are property hazard ratings?** This is a measure of whether the hazard a property poses to the water supply system is -
HIGH
MEDIUM or
LOW
- Who determines a property hazard rating?** Accredited backflow plumbers and licensed plumbers
- A **LOW** Hazard property requires a non-testable backflow prevention containment device installed.
- A **MEDIUM** Hazard property requires a testable double check valve assembly
- A **HIGH** Hazard property must have a registered break tank, reduced pressure zone (RPZ) or registered air gap installed.

PRINCIPLES OF BACKFLOW -

- What is Backflow?** Backflow is the unintended reverse flow of water from a property back into the drinking water supply
- Why is Backflow prevention important?** If there are contaminants in the water, backflow can cause serious or even fatal injuries
- How is backflow prevention achieved?** By the installation of an approved backflow prevention device
- Who can fit backflow prevention devices?** Accredited backflow plumbers and licensed plumbers
- What Backflow device do you need?** Your backflow device must be suitable for your property's hazard rating
- What are property hazard ratings?** This is a measure of whether the hazard a property poses to the water supply system is -
HIGH
MEDIUM or
LOW
- Who determines a property hazard rating?** Accredited backflow plumbers and licensed plumbers
- A **LOW** Hazard property requires a non-testable backflow prevention containment device installed.
- A **MEDIUM** Hazard property requires a testable double check valve assembly
- A **HIGH** Hazard property must have a registered break tank, reduced pressure zone (RPZ) or registered air gap installed.
